1: Gillin E-5 (1932-33)1936 SR9 Carib SR9

553 754 that a practitioner, if he knows the name, can more precisely identify the individual toward whom he wishes malevolent spirits and powers to direct their attentions. Thus Alec, my interpreter, during the four months we were in and about Sawari, although he was very popular with all the inhabitants, succeeded in learning the personal names of none of the individuals living in that settlement. When addressing him or speaking of him, they always used the relationship terms pamu and tseo.

551 A list of a few Carib names, the bearers of which were personally known to me, is given below. In each case they supposedly represent a name which has never been borne by any other individual. In cases in which the name is that of some animal, or an attribute of an animal, no idea of a guardian spirit or of personal totemism is involved, although an individual may be given a certain name because he in some way resembles a certain animal. For instance, James Hendricks is called Krapo (tree frog) because he is thin and nervous.

Male	*Female*
Patakai — Huri fish	Woko — powis, bush turkey
Muturu — black yarrau fish	Puma — short stature
Tanomi — red eye	Tumu — gray hair
Marasi — small camudi snake	Miaiwi — young girl
Marimidi — curly hair	Maipuri — bush cow
Karoshi — little chicken	Wararu — small crab
	Kondi — black child

• 853 Suckling continues either until an ensuing pregnancy or until the child is old enough to walk about. Lactation is not a bar to sexual intercourse, and women who are far advanced in pregnancy are frequently observed nursing children.

[861] 868 Children are rarely punished corporeally, although they are supposedly at the orders of their parents. After the age of about ten, a girl is started to work at household tasks by her mother, and a boy is taken hunting and taught the lore of the bush by the father, thus beginning their serious education in their respective 867 life tasks. Children are present at practically all affairs which take place around the house and settlement, and thus become familiar with the behavior of adults at an early age. Neither sex life, nor family quarrels, nor adult vices are mysteries to them, because they see these things from earliest childhood. At drinking

of children occurs throughout the segments of this population. The Air Strip population of 333 has 164 or 49.0 percent under ten. The remaining population of 218 in the satellite settlements includes 117 under ten. This is 53.7 percent of this portion of the population. As is apparent, the increase in population size and the change in reproductive pattern responsible for it have occurred commonly among the Upper Barama River Carib population.

With regard to the current reproductive pattern, a married state continues to be common for all adults of reproductive age. Also, there are no restrictions on the sexual activity of married couples, and the practice of couvade which rendered a father inactive in all ways for a few weeks after the birth of his child is being abandoned. Extramarital sexual encounters are common among all ages. Nevertheless, young women become pregnant for the first time usually between the ages of eighteen and twenty-two. After this, they have about twenty-five reproductive years during which a woman tends to give birth to a child every twenty to thirty months.[12] According to this pattern, every fertile woman has the potential to reproduce about twelve to thirteen children.[13] The women in monogamous as well as polygynous unions tend to realize this potential. Solien de Gonzáles (1966) has suggested that long term, intensive lactation may supress ovulation. Although the interplay of behavioral and physiological factors may be complex, the reproductive results in this case are clear.

In the general ratio of women to children in the total population, there are eighty-two women between the ages of twenty and forty-four,
